Dear Ms. Sanders:

**RE: APPLICATION FOR PRODUCED WATER DISPOSAL**  
**Shell TH Summit d-25-D/104-H-7, Currier Formation, (WA 17975),**  
**Shell TH Ridge c-91-L/104-H-2, Currier Formation, (WA 17990),**  
**Shell TH Ridge d-91-L/104-H-2, Currier Formation, (WA 17994),**  
**Shell TH Spatsizi b-100-G/104-H-2, Currier Formation, (WA 18007),**  
**Shell TH Hobbit c-80-J/104-H-2, Currier Formation, (WA 18008).**

The Oil and Gas Commission (OGC) has reviewed the application of Shell Canada Limited (Shell) of August 30, 2004 requesting approval to dispose of limited volumes of produced water into coal seams of the Currier Formation in the subject test holes near Klappan. As outlined in Shell's application, the water to be disposed will consist of water swabbed from the Currier coal seams in order to acquire samples of the native water in those coal seams. Small volumes of fresh water to be used to gather pressure transient data will also be disposed into the coal seams. It is the OGC's understanding that the data to be gathered will be used in evaluating the coal bed gas potential of the Currier coal.

Although somewhat unusual, the OGC considers the proposal appropriate. Attached is Approval 04-02-011 for the application, granted under Part 8, Division 3, Section 94 of the *Drilling and Production Regulation*.

The OGC is working with the Ministry of Water, Land and Air Protection (MWLAP) in developing appropriate standards with respect to environmental aspects of coal bed gas development. To assist in this effort, the OGC requests Shell to provide WLAP the information identified in Craig Stewart's

## APPROVAL 04-02-011

**THE PROVINCE OF BRITISH COLUMBIA**  
**PETROLEUM AND NATURAL GAS ACT**  
**DRILLING AND PRODUCTION REGULATION**  
**OIL AND GAS COMMISSION**

---

IN THE MATTER of a scheme of Shell Canada Limited (Shell) for Produced Water Disposal in the Carrier Formation in the Klappan area.

NOW, THEREFORE, pursuant to Part 8, Division 3, Section 94 of the *Drilling and Production Regulation*, the Produced Water Disposal scheme is hereby approved, as such scheme is described in

*an application from Shell to the Commission dated August 30, 2004.*

- 1) The water disposal interval must be in the Carrier coal zone through the test holes:  
Shell TH Summit d-25-D/104-H-7 (WA 17975),  
Shell TH Ridge c-91-L/104-H-2 (WA 17990),  
Shell TH Ridge d-91-L/104-H-2 (WA 17994),  
Shell TH Spatsizi b-100-G/104-H-2 (WA 18007),  
Shell TH Hobbit c-80-J/104-H-2 (WA 18008).
- 2) The total disposal must be completed within 10 days of the commencement of disposal and the total volume disposed per test hole must not exceed 40 m<sup>3</sup>.
- 3) A record of volume of salt water disposed of through each test hole must be included on a Monthly Injection/Disposal Statement, in the prescribed form (BC-S18), which must be submitted to the Oil and Gas Commission not later than the 25th day of the month following the reported month.
- 4) This approval may be modified or rescinded if deemed appropriate through a change in circumstances.

---

Craig Gibson  
Director  
Resource Conservation  
Oil and Gas Commission

DATED AT the City of Victoria, in the Province of British Columbia, this 17<sup>th</sup> day of September 2004.

DATE TYPED: September 14, 2004

September 17, 2004

Craig Gibson, Branch Director  
Resource Conservation,  
Engineering and Geology Branch  
Oil and Gas Commission  
6-1810 Blanshard St.  
Victoria, British Columbia, V8W 9N3

Dear Craig:

Thank you for your email dated Friday September 10, 2004, regarding the disposal of testing fluids back into the "*lowest completed coal seam at the end of test operations for each drill hole*" at the Shell Canada Klappan operation. I appreciate the opportunity to comment on this proposal and to gain a greater understanding of the coal bed methane industry.

It is my understanding that fresh water only will be used for the testwork, and that approximately 40 m<sup>3</sup> of fluid would be discharged to, and contained within, each exploration well. The alternative is to take this fluid to Fort St. John for downhole injection.

Based on my understanding of current industry best management practices, the volume of fluids involved, the expected quality of the re-injected fluids, and the location of the four wells, it would appear that the reasonable procedure would be to inject the fluids back into each completed well.

As this is an emerging potential industry for the northwest, it is critical that the Ministry be kept informed with the on-going exploration activities surrounding coal bed methane, and the potential impact(s) of this activity. Therefore, I would appreciate it if you would direct the company to forward to me a report containing the following information once the Klappan drilling and sampling program has been completed this year.

A brief report containing:

- Location map for the completed drill holes, complete with drill hole stratigraphic information.
- Downhole sample locations for each of the zones tested.

---

**Ministry of  
Water, Land and Air  
Protection**

Smithers BC  
Telephone: 250 847-7260  
Facsimile: 250 847-7728

- Water quality and flow characterization for the zones tested.
- Water quality characterization for the fluids to be injected into the well.
- Final volume of fluids injected into the well, the depth to which they are injected and the stratigraphy into which they are injected.
- Closure information for each completed well.

It is my understanding that all, or a portion of, the information obtained from this exploration program may be considered proprietary. As such, this information would not be circulated nor would it be available to the public through freedom of information requests.

In terms of timing, I would suggest that 60 days from the time of the project completion might provide sufficient time for this report to be submitted.

Should you have any questions or concerns regarding the above, please contact me at 250-847-7416 .

Yours truly,
